

Select A Construction Vendor Based On The Breadth Of Their Product Line

With the entire building taking place in Texas, there is a great need for two seemingly unrelated products. The first, which is needed temporarily during the building process, is for scaffolding. The second, which becomes an integral component of the structure, is insulation. In SanAntonio scaffolding of many types can be found. SanAntonio Insulation is also easily found in many varieties. As you, the builder, search for vendors of these products, the process are simplified if you can purchase all of your materials from a single vendor.

Scaffolding is needed when work must be completed at a level higher than a person standing on the ground can reach. A ladder can be used to reach higher levels, but a ladder is inefficient. Its biggest downside is the small area that can be reached from a ladder. The horizontal reachable area is limited by the armspan of the worker and the width of the ladder. When this area is completed, the ladder must be moved. The vertical reachable area is limited by the height of the safe area of the ladder and the height of the worker.

A scaffold built around the full work area is much more efficient because it allows the worker to just walk from one area to another, without having to waste time moving the ladder. The other consideration is still more vital. Nothing is more important than the safety factor. The danger of ladder use is well known. Uncounted numbers of people have been seriously hurt and even died as a result of falls from a ladder. The metal ladder has the added danger of electrocution when the ladder comes in contact with a live electrical line.

In contrast, instead of being a construction tool, insulation becomes an integral part of the finished building. The insulation in a finished building is unseen but vital for two reasons. It fulfills its purpose by providing a barrier to the elements. In winter, it keeps the heat in and the cold out. In summer, the opposite holds true. Keeping the indoor temperature steady is important to the comfort of the occupants of the building. With the very narrow range of temperatures at which the average person is comfortable, a constant temperature is important. Comfortable people can keep their minds on their tasks instead of fretting about the temperature of the room. An even temperature is also important for cost and environmental reasons. When the cold or warm air is kept out the heating/cooling system can run less. The result is lower heating/cooling bills and a smaller carbon footprint for the building.

Earlier I said these two products are seemingly unrelated. What ties these products together? I see two small ties. First, both products are used in the construction of a large building. Second, a vendor of building materials with a full line of products will offer both of these products. The job of the purchaser is made easier when a variety of products is available from a single vendor. when this happens the builder and the vendor can have a closer, more productive relationship.

About the Author

Connor R. Sullivan recently studied the work of a [San Antonio scaffolding](#) company when he went out for bids on a new project. He worked with a [San Antonio insulation](#) firm as new techniques are sought for the energy crisis.
